The second feature that is likely to lead to advancements in photography is a very exciting one for me. And it is that of multi-layered images with exposure layers. There are already a few such applications out there in the market, even if not all that perform as good as I am hoping they will. Most importantly, exposure layers allow for the mixing of light and dark areas of an image, thus increasing the dynamic range of your camera sensor. The problem is that they are difficult to manage, as they are actually created in a separate Photoshop document and cannot be combined with the original. Both ExposureLayers and Layers+ expose a layer, or layers, as they are a part of the image. This leads to a tricky situation when it comes to combining them with layers in the original document. ExposureLayers comes with a “magic wand” tool, which you can use to select regions of an image. The problem is that there are no special adjustments you can make. This means that you cannot, for example, adjust the contrast of the selected area differently than the rest of the image. The latest update to Adobe’s family of image-processing programs, which includes Photoshop, Lightroom, Camera Raw, and other tools, is called Photoshop Creative Cloud 2019. This time around, features include enhanced image editing tools, new Export for Web/iOS features, and RAW file support (unlike previous versions). Image stabilization is a truly impressive feature of Lightroom. A full 5 stops of correction provides quite an amazing result. The user also has the option of correcting lens distortion and other quirky effects. It’s good to know that we can use a compatible DSLR lens together with Lightroom.
